

The exact prompt for writing system and user message:

Role: You are an expert at AI Content Creation Context: I want to write LinkedIn posts through an automation workflow on Zapier, the posts should follow my own writing style, structure, and template. Task: create the system and user message for the Conversation node in Zapier. Examples of my writing:

Most people experimenting with ElevenLabs are stuck using surface-level descriptions like “friendly tone” or “Indian accent” and then wonder why the output feels flat, robotic, and anything but what they imagined.

Last week, I hosted an intensive workshop to tackle this challenge head-on: how to create personalized, natural-sounding multilingual AI voices that don't just sound good but actually connect.

15+ professionals joined the session, and some have already started building custom voice solutions for their work.

Here's what we explored together:

- The critical parameters of voice design
- How to build an emotional profile of a character before designing a voice
- How to write effective prompts for voice design with LLMs
- A repeatable framework for high-quality, natural voice generation

I'm sharing the recording of the full workshop for FREE.

If you'd like a copy, type VOICE in the comments, and connect with me. I'll send it to you.

LIVE AGENT BUILD SESSION:

I built an ElevenLabs AI Agent that solves the most frustrating voice problems.

If you've ever spent hours adjusting settings and testing prompts, only to get robotic voices or ones that change between conversations or languages, you're not alone.

I've figured out how to create natural, expressive voices that stay consistent in any language, and I'm excited to share my process with you.

This Sunday, 5-7 PM, I am hosting a FREE LIVE BUILD SESSION.

I'll walk you through building an ElevenLabs AI Agent from the ground up, so you can automate everything with just one click.

What we're building together:

An AI agent that generates natural, expressive voices automatically
A system that maintains voice consistency across multiple languages
Prompt templates that eliminate the guesswork and deliver quality every time

You'll walk away with:

The complete agent (ready to use immediately)
Custom GPT for new voice creation
My personal prompt templates that took months to perfect

Perfect for: Educators creating multilingual content, creators scaling production, marketers automating content workflows, or anyone tired of ElevenLabs frustrations.

During the live session, you'll watch the full build process, ask questions as we go, and leave with a working solution.

Ready to automate your voice workflow?

Comment VOICE and connect with me. I'll send you the session link.
If you know anyone who could benefit from this, please tag them.

Bring childhood stories back to life with AI

Ever struggled with creating consistent animated characters across multiple languages?
Each version ends up looking completely different.

As a kid, my favorite thing after school was watching Panchatantra. Flying horses, magical transformations, talking animals, royal courts, the Panchatantra had it all. I've rewatched the whole series on YouTube at least thrice.

For the last few months, I've been building an agent that turns 1 script into animated content in multiple languages with consistent characters.

So I thought: what if I could recreate my favorite childhood stories with Pixar-level animation quality in different vernacular languages? Perfect way to test if my agent can maintain character consistency at scale.

How the agent works:

- 🔍 Downloads scripts from Panchatantra public archives
- 🗣️ Translates English script into vernacular languages using Sarvam AI
- 👥 Creates characters and stores them in a vector database for consistency
- 🎬 Generates images + video using Fal AI
- 🎵 Creates custom voices with ElevenLabs
- 🎞️ Assembles everything seamlessly using Creatomate

If it works for these beloved animal characters, it should work for any brand mascot or educational content.

Sharing snippets of this experiment over the next few weeks.

What's your favorite childhood story? Write it in the comment

What if I told you that \$1 could save you 10 hours of your time every month?

Think about how much time your founders or HR leaders spend on training and onboarding every month.

Now imagine if you could create a one-time video for just \$1 per minute and reuse it again and again. That could save you hours each month to focus on things that matter.

Here's how it works:

- ✅ Set up your custom Avatar in HeyGen (One-time setup)
- ✅ Clone your voice using ElevenLabs
- ✅ Integrate both using N8N automation

All this can be set up for you in a few days or less.

The result? Your digital twin can deliver any training content by simply typing a script. Create unlimited training content without ever touching a camera again.

Perfect for:

Employee onboarding
Compliance training
Product updates
Executive communications

Once set up, you have a 24/7 video production studio that scales infinitely while maintaining that personal touch your team needs.

If this interests you and you want to know more, just type 'interested' in the comments, and I will share a document on how the agent works.

You write one story. But your AI gives you 5 different versions of the same character. Why?

Most AI tools today can generate great single images.
But try building a story, and your characters keep changing.
Different faces. New outfits. Inconsistent styles.
It's hard to stay in the story when your characters keep changing.

I built a multi-agent workflow to fix that.

- ✓ You write the script
- ✓ You define your characters once
- ✓ The AI agent remembers them through a visual memory
- ✓ It turns your story into a scene-by-scene video with the same characters, every time
- ✓ Voices, images, and animations all handled automatically

The creative part stays with you.
The agent just takes care of the heavy lifting and keeps it all consistent.

It works for short product explainers, learning videos, kids stories, anything from 30 seconds to 2 minutes.

Costs around \$6 per 1 min of video.

Take a look at this video made entirely with the workflow.

Curious to see how this agent can bring your ideas to life?

Working on a short doc explaining this step by step. If you want it, comment 'Interested' and connect with me. I'll send it over.
